L3 ANSWER 2 OF 7 SCISEARCH COPYRIGHT 2003 ISI (R) DUPLICATE 1  
AB A heat-stable enzyme was isolated from the cellulase complex of a thermophilic strain of the micromycete *Thielavia terrestris*. The purified enzyme exhibited both endoglucanase and xylanase activities and had a mol mass of 69,000 Daltons and an isoelectric point of 6.4. When the cells were grown at 48 degrees C, the initial activity of the purified enzyme using carboxymethylcellulose as a substrate was 150 nkat/mg and the Michaelis constant was 6.6 g/L. The heat stability of the enzyme was high, losing only 20% of the initial activity after a 6-h incubation at 65 degrees C. When cultures were grown on microcrystalline cellulose and xylose was added after 48 h of growth, endoglucanase and xylanase activities were more than doubled. Similar increases in these activities were observed by growing the cultures on straw.

L3 ANSWER 5 OF 7 HCAPLUS COPYRIGHT 2003 ACS  
AB The prodn. and localization of enzymes in *T. terrestris* strains C464 and NRRL 8126 were compared and the optimum temp. and pH for cellulase activity were detd. High levels of intracellular .beta.-glucosidase activity were detected in the former strain. The intracellular .beta.-glucosidase of both strains were more thermostable than the extracellular enzyme; the half life of *T. terrestris* (C464) endoglucanase activity at 60.degree. was >96 h.
